                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Maize poly ADP-rib
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                            The sequence is the maize poly ADP-ribose polymerase (PARP) gene. The sequence codes a PARP with 982 amino acids (AAY28464). PARP is required in the cell in most cases of DNA repair, recombination, rearrangement and transposition. PARP gene and antisense gene can be used to transform plant cells and alter the metabolic state of the transformed cell. This is useful in enhancing disease resistance in plants and methods of genetic transformation of plants. Plants transformed with either a sense or antisense PARP nucleotide sequence may be utilized to increase transformation frequency in plant cells. The enzyme also plays a role in cellular stress, so may be beneficial for prevention of plant disease or

The present sequence encodes the ZAP2 protein of Zee mays. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The ZAP2 polymucleotide sequences can be used for modulation of programmed cell death in evaluation of programmed cells and the method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous ZAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation contents that are resistant to fungion or nematodes; are male or female sterile, or have better seed-shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or complete plants)

The present sequence encodes the ZAP1 protein of Zea mays. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The ZAP1 polymucleotide sequences can be used for modulation of programmed cell death in eukaryotic cells. The method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous ZAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungil or nematodes; are male or female sterile, or have better seed-shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modulating cell death, growth and stress resistance in eukaryotes, specifically plants, used, e.g. to impart fungus or nematode resistance

```
The present sequence encodes a poly(ADP-ribose) polymerase (PARP) contg. a DNA-binding domain (DBD). The DNA fragment from -29 to + 1127 (nucleotides 67-1220 of this sequence) encoding the DBD can be inserted into vectors which are used for gene therapy. Over-expression of the DBD inhibits the DNA repair function of PARP, so the vectors are useful for gene therapy or tumours, esp. in combination with conventional chemo-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1856 ctggggccgtgtgggtacggtgatcggtagcaacaaactggaacagatgccgtccaagga 1915

This invention describes a novel vector (A), suitable for gene therapy, which contains a DNA insert (I) that encodes a practically complete to poly(deabnosine diphosphate-ribose) polymerase (PARP) which has antitumor activity. PARP is a nuclear DNA repair enzyme (activated by strand breakage), that allows recovery of proliferating cells from the toxic radiation), and protects cells against such damage or other causes of genomic instability. (A) are used for treatment of cancer and for cancer prevention in subjects at high risk (e.g. those with tunor-associated genetic defects). Tunor cells treated with (A) show an increased tendency to die when treated with radiation or chemotherapeutic agent, and in cells that survive this treatment they inhibit genomic instability, so should reduce the likelihood of further development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            both malignant cells and resistance to chemotherapy. This sequence encodes the human poly(ADP-ribose) polymerase described in the invention.

This is found in two different versions, designated TANK2-LOGG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRF1, which is a telomere-specific binding protein. The regulation of telomere length, in which TRF1 has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                            New tankyrase2 polypeptides, useful for treating conditions mediated poly(adenosine diphosphate-ribose) polymerase activity e.g. cancers, inflammatory and autoimmune disorders -

```

This sequence encodes the fusion protein PARPIA/PARP2B. This protein contains amino acids 1-62 of hPARPI fused upstream of amino acids 230-583 of hPARP2. This sequence was amplified using the primer sequences given in AAC85311-40 and AAC85342-51. The fusion protein coding sequence was cloned in a baculovirus expression vector for the expression of the fusion protein. The protein of the invention, hPARP2, causes the covalent addition of polymers of ABP-ribose to protein targets. hPARP2 activity is induced in many instances of exidetive stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify

The present sequence encodes a NAP protein. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polynucleotide sequences can be used for modulation of programmed cell death in catavotic cells. The method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to viich PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungion nematedes; are male or female sterile; or have better seed-shatter properties. The methods are also contined to improve growth of transformed plant cells (and derived calli or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
```

is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polynucleotide sequences can be used for modulation of programmed cell death in elekaryotic cells. The method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant

The present sequence encodes the NAP protein of Zea mays. This protein

Example 1; Page 89-92; 126pp; English.

This sequence represents cDNA encoding a novel human poly(ADP-ribose)
synthetase, sbhPARS2. The invention also relates to fragments,
synthetase, sbhPARS2. The invention also relates to fragments,
constraints and sequences with at least 95% identify to the sbhPARS2
comprising an explexes acid sequence; the recombinant expression
comprising an antibody specific for sbhPARS2 sbhPARS2 sproteins
compounds which inhibit or stimulate its activity or expression level.
compounds which inhibit or stimulate its activity or expression level.
compounds which inhibit or stimulate its activity or expression level.
compounds which inhibit or stimulate its activity or expression level.
compounds which inhibit or stimulate its activity or expression level.
compounds which inhibit or stimulate its activity or expression level.
compounds defined and antagonists of sbhPARS2 are useful for treating human
classase including ischaemia and ischaemic tissue injury (e.g., cerebral
autoimmune disease (e.g., diabetes, multiple sclerosis) and
autoimmune disease (e.g., Parkinson's disease and Alzheimer's
chaemas in sbhPARS2 nucleic acids are useful as diagnostic reagents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diagnostic assays and for screening modulators used for preventing and treating inflammation, autoimmune disease and Alzheimers disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; poly(ADP-ribose) synthetase; sbhPARS2; vaccine; drug screening; ischaemic disorder; cerebral ischaemia; cardiac ischaemia; myocardial infarction; stroke; inflammation; autoimmune disease; diabetes; multiple sclerosis; neurodegenerative disease; Parkinson's disease; Alzheimer's disease; chromosome localisation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /product= "Human poly(ADP-ribose) synthetase sbhPARS2"

```
detecting mutations in the associated gene; as hybridisation probes to isolate full-length subpARS2 CDNAs and sbhPARS2 genomic clones; and for chromosome localisation studies. The sbhPARS2 protein is also useful as an immunogen to produce antibodies for therapeutic use. sbhPARS2 proteins, nucleotides and antibodies are also useful in screening methods for detecting the effect of added compounds on the production of mRNA and protein in cells.

us-09-236-995d-1.rng

neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte metastasis New human poly(ADP-ribose) polymerase for treating inflammatory,

Claim 1; Page 91-93; 129pp; English.

to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, e.g. ischemic stroke, myocardial ischemia or infarction, transplantation, cerebral vasospasm; rheumatoid, osteo- or gouty arbock, gram negative or positive sepsis, toxic shock syndrome; multiple organ injury syndrome secondary to septicemia, trauma, or hemorrhage; allergic or vernal conjunctivitis, uveits, thyroid-associated ophthalmopathy; eosinophilic granuloma; asthma, chronic bronchitis, allergic rhinitis, ARDS, chronic obstructive pulmonary disease, silicosis, pulmonary sarcoidosis, pleurisy, alveolitis, vasculitis, pneumonia, pronchiectasis, pulmonary oxygen toxicity; reperfusion injury of the myocardium, brain or extremilies; cystic fibrosis; keloid formation, scar tissue formation; atherosclerosis; systemic lupus cryndrome; graft versus host disease, allograft rejection; chronic glomerulonephritis; inflammatory bowel disease, Crohn's disease, contain, and manalory dermaloses. antigen-antibody complex mediated diseases; hypovolemic shock; Type 1 diabetes mellitus; acute and delayed hypersensitivity; disease states due to leukozyte dyscrasia and metastasis; thermal injury; granulocyte transfusion associated syndromes; and cytokine-induced toxicity. hPARP2 and antibodies to it, can also be used to diagnose these myalgias contact or atopic dermatitis, psoriasis, urticaria, fever and myalgiass due to infection; meningitis, encephalitis, and brain and spinal cord injury due to minor trauma; Sjogren's syndrome; diseases involving leukocyte diapedesis; alcoholic hepatitis; bacterial pneumonia; This sequence encodes human poly(ADP-ribose) polymerase (hPARP2). This protein causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage. 

Sequence 1814 BP; 558 A; 389 C; 462 G; 405 T; 0 other;

This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD<sup>+</sup>-binding site and no zinc finger
sequences with a functional NAD<sup>+</sup>-binding site and no zinc finger
sequences. PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
classase condition, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence encodes the
human PARP2 protein used in the method of the invention.
                                                                                                                                                                                                                                    Ή
                                                                                                                                                                                                                                                                                                                           Novel genes and proteins, antibodies and binding partners useful in diagnosis and therapy of energy deficiency associated disease conditions -
                                                                                                                                                                                                                                      Lemaire

```
Parkinson's disease), treating or preventing ischemic damage
CC (specifically renal damage after renal ischemia or during and after
CC (specifically renal damage after renal ischemia), treating
CC kidney transplantation or heart damage after cardiac ischemia), treating
CC epilepsy, specifically generalized epileptic attacks (e.g. petit mal and
CC conic-clonic attacks) or partial epileptic attacks (e.g. temporal lope
CC donic-clonic attacks), treating malcrohifarction (e.g. during and
CC after heart valve replacement, aneurysm resectioning and heart
CC after heart valve replacement, aneurysm resectioning and heart
CC arteries (e.g. after PCTA or by pass operations) or peripheral arteries
CC arteries; (e.g. after PCTA or by pass operations) or peripheral arteries
CC after its mechanical or drug-induced lysis and treating tumors and
CC after metastasis, sepsis and septic shock, inflammatory and rheumatic
CC their metastasis, sepsis and septic shock, inflammatory and rheumatic
CC their metastasis, sepsis and septic shock, inflammatory and rheumatic
CC their matastasis, sepsis and septic shock, inflammatory and rheumatic
CC their matastasis, sepsis and septic shock, inflammatory and rheumatic
CC their matastasis, sepsis and septic shock, inflammatory and rheumatic
CC their matastasis, sepsis and septic shock, inflammatory and the multiply the particular (I) have very strong PARP2 inhibitory activity (e.g. with K_i values of 1-20 nM) and high selectivity for PARP2 relative to
CC ARRP1 (generally by a factor of more than 5).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 derivatives (I) which are used for the treatment or prophylaxis of diseases associated with elevated poly (ADP-ribose)-polymerase (PARP; EC 2.4.2.30) activity. The products of the invention have moortopic, neuroprotective, cerebroprotective, antiparkinsonian, nephrotropic, anticonvulsant, cytostatic, antibacterial, immunosuppressive, antinfammatory, antirheumatic, antiarthritic, antidabhetic. (I) are specially used for treating or preventing neurodemerative disease or neuronal damage (specifically associated with ischemia, trauma or massive bleeding, especially apoplexy or partires, antiment of antidation or disease or neuronal damage (specifically associated beting location).
                                                                                                                                                                                                                                                                                                  Drugs for inhibiting PARP or especially homologous enzymes comprising 4-substituted phthalazinone derivatives, useful e.g. for treating neurodegenerative disease, ischemic damage, tumors or diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel 4-substituted 2H-phthalazin-1-one
                                                                                                                                                               Lubisch W, Sadowski J, Kock M, Hoeger T;
                                                                                                                                                                                                                                                                                                                                                                                                                                         Example A; Page 9-12; 14pp; German.

Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -

Claim 5; Page 4521-4522; 5507pp; English.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORPX open reading frames 1 to 3161. The ORPX sequences have activities such as: cytostatic; hepatotropic; vulnerary; catiporatatic; antiporatanic antiarthritic; immunosuppressant; immunosuppressant; immunosuppressant; immunostimulant: cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressant; cantinflammatory; antiboreticial antiviral; antifungal; antithumatic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; cantidiabetic; hypotensive; dermatological; antithusical; antibuagical; antithusical; antibuagical; antithusical; antibuagical; antithusical; antibuagical; antibuag coagulation; to inhibit thrombosis; and as a contraceptive.

RESULT 15

AAH14941 standard; cDNA; 1980 BP.

the present invention describes pramer sets for synthesisting 300.2

full-length connact connected in the specification. Where a primer set

comprises: (a) an oliqo-for primer and an oligonucleotide complementary

cc to the complementary strand of a polynucleotide which comprises one of

the 560 nucleotide sequences defined in the specification, where the

oligonucleotide comprising a sequence complementary to the

cc an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

complementary strand of a polynucleotide which complementary to a

complementary strand of a polynucleotide which complementary to a

complementary strand of a polynucleotide where the

complementary strand of a polynucleotide where the

cc plynucleotide which comprises a 1'-end sequence complementary to a

coligonucleotide comprises at least 15 nucleotides and the combination of

the 5'-end sequence/1'-end sequence is selected from those defined in

the specification. The primers are useful for synthesisising polynucleotides,

cc particularly full-length cDNAs. The primers are also useful for the

cc particularly full-length cDNAs. The primers are also useful for the

cc cDNAS aeasily without any specialised methods. AAH03166 to AAH13628 and

cc AAH13633 to AAH18412 represent human cDNA sequences; AAB92446 to

ABB95893 represent human amino acid sequences; and AAH13629 to AAH13632

crepresent oligonucleotides, all of which are used in the exemplification Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss. Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the The present invention describes primer sets for synthesising 5602 oca r, isogai T, Nishikawa T, Hayashi K, Saito K, Y. ```
/note="Organ: embryo: Vector: pBluescript SK; Site_1: xhoI : Site_2: EcoRI; Library was prepared by Statagene using the Uni-ZaP xR system (Stratagene BN937328-12). Clones were picked by a clobe after blue/white selection (ampicillin resistance - use 100 micrograms/microliter). Developed from a pool of equal amounts of RNA from developing embryos sampled at 14, 21, 28 and 35 days after pollination of the Illinois High Oil Maize Strain Cycle 90. This closed strain has been selected for high oil concentration for 90 generations and originates from the 1890s era open pollinated variety Burr's White"

//note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
Xho1; The cDNA library was constructed from mRNA isolated
from mature seed pods of greenhouse grown plants prior to
senescence for the cultivar KPI. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with a XhoI restriction site. EcoRI
poly(dT) sequence with a XhoI restriction site. EcoRI
poly(dT) sequence with a Complement of the blunt-ended cDNA fragments
followed by XhoI digestion. The cDNA fragments
directionally cloned into the EcoRI-XhoI restriction site
of the pBluescript vector. The ligated cDNA fragments
were transformed into DH10B host cells (GibcoBRL). This
library was constructed in the laboratory of Dr. Randy
Shoemaker."

```
carbohydrate. Monocotyledonous rice is a diploid plant
(2n=24) with a haploid genome equivalent of 431 Mbp
(Arunganathan and Barle, 1991). The relatively small
genome of rice, three times larger than that of
Arabidopsis, makes it suitable for genomic studies. In
order to facilitate positional cloning, physical mapping
and genome sequencing of rice, we have constructed a BAC
library from Oryza sativa, Nipponbare variety. The
library contains 36.864 clones with an average insert size
of 128.5 Kb providing 10.9 haploid genome equivalents. The
deep coverage allows the isolation a particular sequence
with a probablity of 99.98. Two high density filters,
each containing 18.432 clones (doubly spotted), represent
the whole library for colony screening.
